AWS WAF
Protect your web applications from common web exploits
AWS WAF is a web application firewall service that lets you monitor web requests forwarded to your AWS resources. You can protect CloudFront distributions globally, or regional resources including API Gateway APIs, Application Load Balancers, AppSync GraphQL APIs, Cognito user pools, App Runner services, Verified Access instances, and AWS Amplify applications. Protection is based on conditions you specify, such as originating IP addresses and request patterns.
Get started with AWS WAF
Set up protection for your Amazon CloudFront distributions, Application Load Balancers, Amazon API Gateway stages and other AWS services in just under 5 minutes.

Protection packs (web ACLs)
Create protection pack (web ACL)
Customize protection pack (web ACL) - optional Info
Default rule actions
Configure the default rule action which defaults to using both Count and Block actions based on the best practice configurations within the selected pack.
Use recommended defaults for Count and Block actions
Sets all rules to use their recommended configurations.
Set all to Count action
Test your rules in Count mode to evaluate their effectiveness before enabling Block mode. Count mode logs matching requests without blocking them.
Rule configuration Info
You may customize the configurations of these rules to your needs. Some configuration updates may increase costs within the scope of the provided estimate.
Rate limits
IP addresses
IP set for addresses to block
Use a stored IP set for consistent, reusable, and scalable IP-based security across multiple protection packs (web ACLs).
WebAppIPset
IP addresses to block
Any IP address included will automatically be blocked, superseding other protection rules.
